**Subject:** NO-DES Water Flushing

It is the Town's goal to provide our customers with high quality drinking water that you can drink with confidence. One of these steps involves flushing our lines to move stagnant water and remove debris caused by pipe scaling. As some of you are aware, we also have a history of sand in our system that has prevented us from doing high velocity flushing, which would normally remove the scaling and stagnant water.

The Town has decided to bring in a contractor, ValveTek Utility Services, to do a specialized flushing method called NO-DES. The NO-DES system actually recirculates the water through two filtering vessels removing all debris and re-treating the water if needed. This is a proven method that works in an efficient manner as the reuse of water is critical in today's drought.

This project will continue on August 11, 2015 and is expected to be completed by the end of the week.
